## 1 General Information

### 1.1 Documentation

The following documents are associated with this document:

- The data sheet describes the technical data, the dimensions, the pin assignment, the accessories and the order key.
- The installation instructions describe the mechanical and electrical installation with all safety-relevant conditions and the associated technical specifications.
- The User manual for the sensor commissioning and integration into a fieldbus system.
- EDS file (electronic data sheet); this file enables integration and configuration in a CANopen network by means of commercial CANopen configurators.

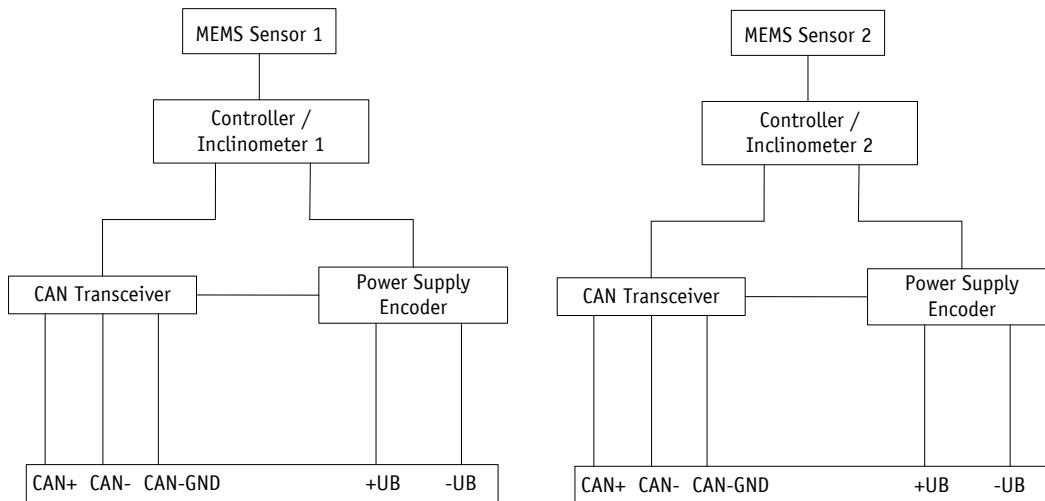

You can also download these documents at <http://www.siko-global.com/p/ik1r>.

### 1.2 Definitions

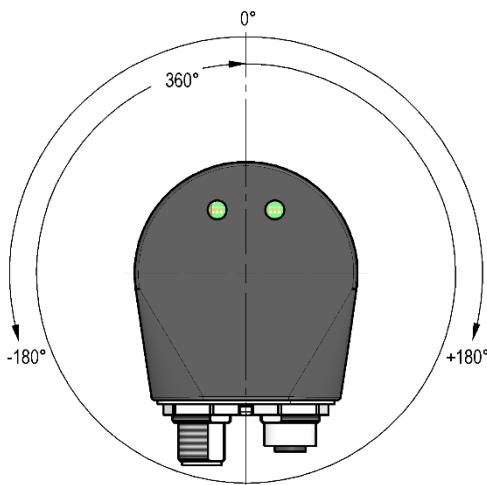

Decimal values are given as numbers without addition (e. g. 1234), except when indicated in direct connection with binary or hexadecimal values. In this case, the extension "d" is used (e. g. 1234d). Binary values are identified by adding "b" (e. g. 1011b) to the figures whereas hexadecimal values are extended by "h" (e. g. 280h).

## 2 Intended use

The IK1R is designed for redundant slope detection in one dimension. The inclinometer can be parameterized and read out via the CAN interface using the CANopen protocol and CANopen Safety protocol. The sensor can be used for applications up to Performance Level D (PLd) in the overall system. For this purpose, a higher-level, safe evaluation device is required because the inclinometer sensor with its internal sensor diagnosis is not able to initiate actions itself such as the initiation of a safe state. Increased demands are placed on the electrical and mechanical connection of the inclinometer.

*Fig. 1: Block diagram*

*Fig. 2: Measurement axis*

2.1

## Switching on the supply voltage

The inclinometer initializes after being switched on. The configuration parameters are loaded from the nonvolatile memory into the main memory of the controller during initialization.

Each sensor will work with its default values as long as no changes have been made to it. With parameters changed, the sensor will work with the changed data, which must be stored if they are intended to be used after power off/on.

After completing the initialization procedure, each inclinometer sends a specific NMT command, the boot-up message, which informs the system about their availability. The inclinometer is now in the pre-operational mode. In this state, the sensor can be parameterized via SDO commands in accordance with the requirements of the application. This concerns both the configuration parameters of the sensor system and the way in which it makes its slope values available to the system (asynchronous or synchronous data transmission).

## 2.2 Device identification

To ensure safe operation, the following parameters should be read and verified with a Safety inclinometer before each parameterization and commissioning.

- [1000h: Device Type](#)
- [1018h: Identity Object](#) Sub-index 01h Vendor ID
- [1018h: Identity Object](#) Sub-index 02h Product Code
- [1018h: Identity Object](#) Sub-index 03h Revision number
- [1018h: Identity Object](#) Sub-index 04h Serial number

# 3 Functional description

## 3.1 Measuring range

The inclinometer supports 2 measuring ranges. A measuring range of 0 ... 360° (resolution 0.1°) is set by default. The measuring range can be switched to ±180° (resolution 0.1°) via object [6011h: Slope long16 operating parameter](#).

## 3.2 Calibration

Owing to the absolute system, calibration is required only once when the system is taken into operation and can be performed at any position. This enables alignment of the inclinometer zero point with the system's mechanical zero point. During calibration, the calibration value is used to calculate the slope value.

## 3.3 Reset to factory settings

To return to the original condition of the device as delivered, there exist the following options:

| Access   | Coding       | Settings are restored |                                       |
|--|--------------|-----------------------|---------------------------------------|
| CANopen (see object <a href="#">1011h: Restore Parameter</a> ) | 1011h "load" | Sub-index 1           | All parameters                        |
|  |              | Sub-index 2           | Only bus parameters                   |
|  |              | Sub-index 3           | Only CiA 410 parameters               |
|  |              | Sub-index 4           | Only manufacturer-specific parameters |

Table 1: Access to factory settings

## 4

**Communication via CAN bus (CANopen and CANopen Safety)**

The basis for the inclinometer IK1R is the CANopen communication profile CiA 301 V4.2, the device profile for inclinometer CiA 410 V2.0.0. The CANopen Safety protocol EN50325-5 is additionally implemented for safety-relevant applications. Safety-relevant applications as well as safety-non-relevant applications can be operated on a CAN bus. The IK1R supports device class C1. The details required for a better understanding of the operation are included in this documentation. If more in-depth information is required, we recommend the applicable technical literature on CAN, CANopen and CANopen Safety.

**4.1 Telegram structure**

The data telegram of a CAN message consists of the following fields:

|     |                     |               |                          |     |           |
|-----|---------------------|---------------|--------------------------|-----|-----------|
| SOF | Identifier (COB ID) | Control field | Data field (max. 8 Byte) | CRC | ACK / EOF |
|-----|---------------------|---------------|--------------------------|-----|-----------|

**SOF:**

(Start of Frame) start bit of the telegram.

**Identifier (COB ID):**

- By means of the identifier, all bus subscribers check whether the message is relevant for each of them.
- The identifier determines the priority of the message. The lower the value of the identifier, the higher is the priority of the message. This enables preferential transmission of important messages via the bus.

The Identifier field contains the identifier as well as bits for the recognition of the length of the identifiers (11 or 29 bits). The device address, channel selection as well as data direction are determined via the identifier as well.

Thus, the 11bits identifier (COB identifier) consists of a 4bit function code and a 7bit node number:

| Bit no.    | 10              | 9 | 8 | 7 | 6 | 5 | 4 | 3                     | 2 | 1 | 0 |
|------------|-----------------|---|---|---|---|---|---|-----------------------|---|---|---|
| Type       | Functional code |   |   |   |   |   |   | Node number (Node ID) |   |   |   |
| Assignment | x               | x | x | x | 0 | 0 | x | x                     | x | x | x |

The following functional codes have been defined in the "Pre-defined Connection Set" (only the functional codes used in the present device are shown):

| Object                   | Functional code | Resulting COB ID       | Object | Page               |
|--------------------------|-----------------|------------------------|--------|--------------------|
| Network management (NMT) | 0000b           | 0                      | -      | <a href="#">9</a>  |
| SYNC message             | 0001b           | 128d (80h)             | 1005h  | <a href="#">11</a> |
| Emergency message        | 0001b           | 128d (80h) + Node ID   | 1014h  | <a href="#">20</a> |
| TPDO1                    | 0011b           | 384d (180h) + Node ID  | 1800h  | <a href="#">11</a> |
| SDO (tx)                 | 1011b           | 1408d (580h) + Node ID | 1200h  | <a href="#">12</a> |
| SDO (rx)                 | 1100b           | 1536d (600h) + Node ID | 1200h  | <a href="#">12</a> |
| Heartbeat message        | 1110b           | 1792d (700h) + Node ID | -      | <a href="#">22</a> |
| Node Guard message       | 1110b           | 1792d (700h) + Node ID | -      | <a href="#">21</a> |

| Object   | Functional code | Resulting COB ID | Object | Page               |
|----------|-----------------|------------------|--------|--------------------|
| LSS (tx) | -               | 2020d (7E4h)     | -      | <a href="#">23</a> |
| LSS (rx) | -               | 2021d (7E5h)     | -      | <a href="#">23</a> |

*Table 2: Overview of COB identifiers*

Changes to COB IDs are only possible in the PRE-OPERATIONAL NMT status. First, the COB ID must be switched invalid via bit 31 = 1b before it can be changed and reactivated.

The COB ID of the Sync object is an exception, where bit 30 must be = 0b to enable the COB ID to be changed. As bit 30 cannot be set to 1b in the inclinometer, the COB ID could be changed at any time.

The node number (Node ID) (see also object [5F0Ah: Node ID and baud rate Bus CAN](#)) is assigned once in every bus system with configuration of the master on IK1R. The node numbers range from 1 to 127. Node ID = 0 is reserved and must not be used.

The adoption of a Node ID or baud rate which was reset occurs only after re-initialization (see chapter [4.2.1](#)).

In the case of the inclinometer IK1R, an inclinometer with node ID 3 (1h) and the redundant inclinometer with node ID 4 (2h) are delivered ex works.

#### **Control field:**

Contains bit-by-bit information concerning the number of user data and determines whether a data frame or RTR frame (Remote Transmission Request frame) is concerned.

#### **Data field:**

Contains up to 8 bytes of user data. The user data has a different meaning depending on the channel selection.

#### **CRC:**

Contains bits for error detection.

#### **ACK/EOF:**

The ACK/EOF field contains telegram acknowledgment bits as well as bits for determining the end of telegram.

For a detailed description of the telegram please refer to the applicable technical CAN literature. For simplification, only identifier (COB ID) and data field will be dealt with in the subsequent telegram descriptions.

## **4.2 Node control**

### **4.2.1 Network management (NMT) services**

The master configures, manages and monitors network nodes via the NMT service. The device is always in one of the four communication states "INITIALIZATION", "PRE-OPERATIONAL", "OPERATIONAL" or "STOPPED" (see [Fig. 3](#))

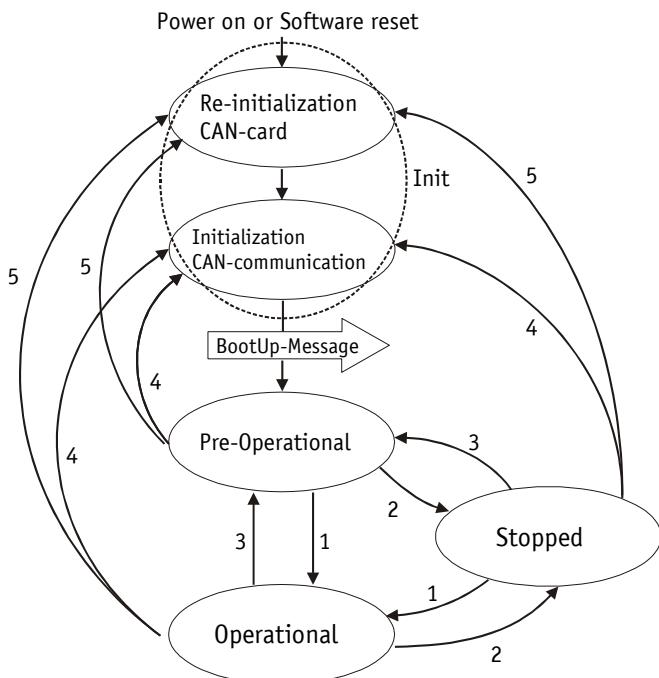

Fig. 3: NMT status diagram

#### 4.2.1.1 NMT communication states

##### NMT Status INITIALIZATION

The device is not involved in the bus actions in this state. All hardware and software components are initialized. This state is attained after switching on the device or after receipt of the command code 81h ("Reset node") of the own or global addresses. Following receipt of the command code 82h ("Reset Communication"), the inclinometer will enter the initialization stage as well. But only hardware and software associated with CAN communication will be reinitialized. The device signals automatically the completion of initialization by sending a boot-up message. As soon as the boot-up message was sent successfully, the device will enter the "PRE-OPERATIONAL" status.

##### NMT Status PRE-OPERATIONAL

Parameterization data (SDO) can be exchanged in the pre-operational mode. However, no process data (PDO's) is transferred.

##### NMT Status OPERATIONAL

The exchange of process data is enabled as well. However, COB ID and Transmit PDO Mapping parameters can no longer be changed in this status.

##### NMT Status STOPPED

Communication is stopped except for heartbeat and node guarding. Only NMT communication is enabled.

#### 4.2.1.2 Toggling between the NMT communication states

For toggling between the communications states, telegrams with the following structures are used:

| Change of state                         |                                      | Transition in Fig. 3 | COB ID | Com-mand | Node ID |
|---|--------------------------------------|----------------------|--------|----------|---------|
| from                                    | to                                   |                      |        |          |         |
| PRE-OPERATIONAL / STOPPED               | OPERATIONAL                          | 1d                   | 0h     | 01h      | x       |
| OPERATIONAL/ PRE-OPERATIONAL            | STOPPED                              | 2d                   | 0h     | 02h      | x       |
| OPERATIONAL / STOPPED                   | PRE-OPERATIONAL                      | 3d                   | 0h     | 80h      | x       |
| OPERATIONAL / PRE-OPERATIONAL / STOPPED | INITIALIZATION (Reset Node)          | 5d                   | 0h     | 81h      | x       |
| OPERATIONAL / PRE-OPERATIONAL / STOPPED | INITIALIZATION (Reset Communication) | 4d                   | 0h     | 82h      | x       |

Table 3: Toggling between communication states

If x = 0h is transferred as Node ID, then the message is intended for all bus subscribers.

#### 4.2.2 Boot-Up

The COB ID of the boot-up message is made up of 700h and the Node ID. The "Initialization" NMT status is output as data content.

| COB ID         | Byte 0 |
|----------------|--------|
| 700h + Node ID | 00h    |

Table 4: Boot-Up message

#### 4.2.3 SYNC object

CANopen enables the simultaneous query of all inputs and the simultaneous setting of all outputs. The synchronization message (SYNC), a CAN message with high priority serves this purpose. The identifier of the Sync object can be set via object 1005h (see [1005h: COB ID SYNC message](#)).

### 4.3 Process data exchange

#### 4.3.1 Transfer of process data objects (PDO)

Process data objects (PDO) serve for fast exchange of process data. A maximum of 8 bytes of user data can be transferred in a PDO. The IK1R supports the Transmit PDO services TPD01 and TPD02 according to CiA 301 and CiA 410.

#### 4.3.1.1 Transmit-PDO (from the IK1R to the master)

PDO transfer from the IK1R to the bus master can be initiated as a result of various events:

- asynchronous, controlled by an internal device timer
- synchronous as a response to a SYNC telegram
- as a response to an RTR message

The TPD01 contains the slope long16. The transfer behavior of TPD01 is determined via the objects 1800h and 1A00h and is assigned to asynchronous transmission. Synchronous data transmission is set at delivery. Other TPDOs are not supported.

| COB ID                  | Process data in binary code |              |
|-------------------------|-----------------------------|--------------|
|                         | Byte 0 (LSB)                | Byte 1 (MSB) |
| TPD01<br>180h + Node ID | Slope long16                |              |

Table 5: TPDO message

#### Asynchronous data transmission

If a TPD01 is to be sent cyclically, 254 (FEh) or 255 (FFh) must be entered in object 1800h, sub-index 02h. The cycle time can be entered in milliseconds in object 1800h, sub-index 05h. The TPD01 will not be sent if the value 0 ms is written. The function is disabled. The minimum value to be set is 1h (= 1 ms).

#### Synchronous data transfer

As delivered, the device responds to every SYNC Message received with the output of the TPD01 message. 1h is entered for synchronous transmission in object 1800h, sub-index 02h. If a value n is entered between 1d and 240d (= F0h), the device will respond to every nth SYNC message.

#### RTR

Queries can be sent via RTR (see chapter [4.1](#)) to TPD01.

### 4.4 Parameter data exchange

#### 4.4.1 Transmission of Service Data Objects (SDO)

Service data objects serve mainly device configuration via the directory of objects. SDOs in the expedited Request/Response and in the normal Request/Response are supported.

The identifier is set to 11 bits and cannot be changed.

Two SDO services are available:

- SDO (rx) (Master → Slave): 600h + Node ID
- SDO (tx) (Slave → Master): 580h + Node ID

Two SDO services are available!

#### 4.4.1.1 Expedited Request/Response

Except for reading the object [100Ah: Manufacturer Software Version](#) all SDOs are exchanged between two subscribers in the expedited Request/Response method. The user data is provided already with the initialization message.

SDO messages are set up as follows:

| COB ID                 | User data in binary code  |               |               |           |                       |        |        |               |
|------------------------|---------------------------|---------------|---------------|-----------|-----------------------|--------|--------|---------------|
|                        | Byte 0<br>read /<br>write | Byte 1<br>LSB | Byte 2<br>MSB | Byte 3    | Byte 4<br>LSB         | Byte 5 | Byte 6 | Byte 7<br>MSB |
| SDO rx/tx +<br>Node ID | Command<br>byte           | Index         |               | Sub-index | User data (parameter) |        |        |               |

#### Command byte, byte 0:

The command byte determines the type of access and the number of valid data bytes. The following command bytes are valid for the IK1R:

| Command byte   | Type | Function  |
|----------------|------|---|
| Write Request  | 23h  | SDO (rx), Initiate Download Request, expedited  |
| Write Request  | 2Bh  | SDO (rx), Initiate Download Request, expedited  |
| Write Request  | 2Fh  | SDO (rx), Initiate Download Request, expedited  |
| Write Request  | 60h  | SDO (tx), Initiate Download Response, expedited |
| Read Request   | 40h  | SDO (rx), Initiate Upload Request               |
| Read Response  | 43h  | SDO (tx), Initiate Upload Response, expedited   |
| Read Response  | 4Bh  | SDO (tx), Initiate Upload Response, expedited   |
| Read Response  | 4Fh  | SDO (tx), Initiate Upload Response, expedited   |
| Error Response | 80h  | SDO (tx), Abort Domain Transfer                 |

Table 6: Command coding

#### Index, bytes 1 and 2:

The index (object number) is entered in the user data byte 2 (low byte) and user data byte 3 (high byte) in the Intel data format. Here, the index of the object to be parameterized is entered.

#### Sub-index, byte 3:

The sub-index indicates the number of the fields for objects realized as an array.

**User data (parameters), Byte 4 ... 7:**

In the user data, the value of the parameter is entered in left-aligned Intel notation. Byte 4 = Low-Byte ... Byte 7 = High-Byte.

**4.4.1.2 Normal Request/Response**

If more than 4 bytes of service data are to be transferred, the data is exchanged between two subscribers via the normal Request/Response. This procedure is also initiated by an initialization message, and the actual user data will be transferred in the subsequent segment messages.

For the IK1R this is only the case with reading of the object [100Ah: Manufacturer Software Version](#).

The initialization message has the following structure:

| COB ID                 | User data in binary code  |               |               |                                 |               |        |        |               |
|------------------------|---------------------------|---------------|---------------|---------------------------------|---------------|--------|--------|---------------|
|                        | Byte 0<br>read /<br>write | Byte 1<br>LSB | Byte 2<br>MSB | Byte 3                          | Byte 4<br>LSB | Byte 5 | Byte 6 | Byte 7<br>MSB |
| SDO rx/tx +<br>Node ID | Command<br>byte           | Index         | Sub-index     | User data (number of user data) |               |        |        |               |

The segment message has the following structure:

| COB ID                 | User data in binary code  |               |        |        |        |        |        |               |
|------------------------|---------------------------|---------------|--------|--------|--------|--------|--------|---------------|
|                        | Byte 0<br>read /<br>write | Byte 1<br>LSB | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7<br>MSB |
| SDO rx/tx +<br>Node ID | Command<br>byte           | User data     |        |        |        |        |        |               |

**Initialization and segment message: Command byte, byte 0:**

The command byte determines the type of access and the number of valid data bytes. The following command bytes are valid for the IK1R:

| Command byte   |     | Type                                      | Function   |
|----------------|-----|---|--|
| Read Request   | 40h | SDO (rx), Normal Initiate Upload Request  | Request parameter from slave (number of bytes to be transferred) |
| Read Request   | 60h | SDO (rx), Normal Segment Upload Request   | Request parameter from slave (user data)                         |
| Read Response  | 41h | SDO (tx), Normal Initiate Upload Response | Report parameter to master (number of bytes to be transferred)   |
| Read Response  | 03h | SDO (tx), Normal Segment Upload Response  | Report parameter to master (user data)                           |
| Error Response | 80h | SDO (tx), Abort Domain Transfer           | Slave reports error code to master                               |

Table 7: Command coding

**Initialization message: Index, bytes 1 and 2:**

The index (object number) is entered in the user data byte 2 (low byte) and in the user data byte 3 (high byte) in the Intel data format. Here, the index of the object to be parameterized is entered.

**Initialization message: Sub-index, byte 3:**

The sub-index indicates the number of the fields for objects realized as an array.

**Initialization message: User data (parameters), byte 4 ... 7:**

In the service data range, the value of the parameter is entered in left-aligned Intel notation. Byte 4 = Low-Byte ... Byte 7 = High-Byte.

**Segment message: User data (parameters), Byte 1 ... 7:**

In the user data range, the value of the parameter is entered in left-aligned Intel notation. Byte 1 = Low-Byte ... Byte 7 = High-Byte.

**4.4.1.3 Error Response in SDO exchange**

With invalid access, an error message (Abort) is returned to the master.

The error codes are described in the CANopen profile (CiA 301) or in the inclinometer profile (CiA 410), respectively. The table below shows the error codes used:

| Error code | Description   |
|------------|---|
| 05030000h  | Toggle bit in Normal Transfer of Request/Response unequal.                                  |
| 06010000h  | Wrong access to an object.  |
| 06010001h  | Read access to Write-Only.  |
| 06010002h  | Write access to Read-Only.  |
| 06020000h  | Object doesn't exist in the object directory.   |
| 06090011h  | Sub-index does not exist.   |
| 06090030h  | Wrong value range of selected parameter.  |
| 08000020h  | Parameters cannot be transferred to application or stored.                                  |
| 08000022h  | Parameters cannot be transferred to application or stored due to the current device status. |
| 08000024h  | No data available   |

Table 8: Error codes

**4.4.1.4 SDO examples****Example of reading SDO parameters with the expedited Request/Response:**

The calibration value stored in object 1017h of the directory of objects is to be read from the slave with device address 3h.

Calculation of the identifier: 600h + Node ID = 600h +3h = 603h

Command: 40h

Index: 1017h

Sub-index: 00h

The current value is 1000d = 3E8h.

Request of master from slave with Node ID 3h:

| COB ID | User data |         |         |           |        |        |        |        |
|--------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 603h   | 40h       | 17h     | 10h     | 00h       | x      | x      | x      | x      |

Response to the request by the slave:

Calculation of the identifier: 580h + Node ID = 583h

| COB ID | User data              |         |         |           |        |        |        |        |
|--------|------------------------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command                | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 583h   | 4Bh<br>(4 bytes valid) | 17h     | 10h     | 00h       | E8h    | 03h    | 00h    | 00h    |

### Example of writing SDO parameters with the expedited Request/Response:

In the slave with device address 3h the cycle timer, which is stored with 2 bytes in object 1017h of the object dictionary, is to be changed.

Calculation of the identifier: 600h + Node ID = 600h + 3h = 603h

Command: 2 bytes are to be written: 2Bh

Index: 1017h

Sub-index: 00h

The new value shall be 100d = 64h.

Writing of a value from master to slave with Node ID 3h:

| COB ID | User data              |         |         |           |        |        |        |        |
|--------|------------------------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command                | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 603h   | 2Bh<br>(2 bytes valid) | 17h     | 10h     | 00h       | 64h    | 00h    | 00h    | 00h    |

Response to the command by the slave:

Calculation of the identifier: 580h + Node ID = 580h + 3h = 583h

| COB ID | User data |         |         |           |        |        |        |        |
|--------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 583h   | 60h       | 17h     | 10h     | 00h       | 00h    | 00h    | 00h    | 00h    |

### Example of reading SDO parameters with normal Request/Response:

The manufacturer device name stored in object 100Ah of the directory of objects is to be read from the IK1R with device address 3h.

Calculation of the identifier:  $600\text{h} + \text{Node ID} = 600\text{h} + 3\text{h} = 603\text{h}$

Command: 40h

Index: 100Ah

Sub-index: 00h

First request (= initialization) of master from slave with Node ID 3h:

| COB ID | User data |         |         |           |        |        |        |        |
|--------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 603h   | 40h       | 0Ah     | 10h     | 00h       | x      | x      | x      | x      |

Response to the request by the slave:

Calculation of the identifier:  $580\text{h} + \text{Node ID} = 583\text{h}$

| COB ID | User data |         |         |           |        |        |        |        |
|--------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 583h   | 41h       | 0Ah     | 10h     | 00h       | 07h    | 00h    | 00h    | 00h    |

Number of expected user data bytes: 7

Second request of master from slave with Node ID 3h:

| COB ID | User data |         |         |           |        |        |        |        |
|--------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|        | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 603h   | 60h       | 00h     | 00h     | 00h       | x      | x      | x      | x      |

Response to the request by the slave:

| COB ID | User data |              |              |              |              |              |              |              |
|--------|-----------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
|        | Command   | Data 0       | Data 1       | Data 2       | Data 3       | Data 4       | Data 5       | Data 6       |
| 583h   | 01h       | 30h<br>("0") | 2Eh<br>(".") | 39h<br>("9") | 2Eh<br>(".") | 30h<br>("0") | 30h<br>("0") | 39h<br>("9") |

## 4.5 Safety data exchange

### 4.5.1 Transfer of safety-relevant data objects (SRDO)

Safety-relevant data objects (SRDO) serve the cyclic exchange of safe data in the Operational NMT state. An SRDO consists always of 2 messages with different COB IDs and bit-by-bit inverted data. A maximum of 8 bytes of user data can be transferred in an SRDO. The IK1R supports the Safety Transmit services SRD01 for the Slope long16 (2 bytes) according to EN50325-5 and CiA 410. The transmit behavior of SRDO is determined via the objects 1301h, 1381h and 6200h. Mapping is static and cannot be changed.

| COB ID                                 | Data in binary code       |              |
|--|---------------------------|--------------|
|  | Data 0 (LSB)              | Data 1 (MSB) |
| SRD01 COB ID1<br>000000FFh + 2*Node ID | Slope long16              |              |
| SRD01 COB ID2<br>00000100h + 2*Node ID | Bit-inverted Slope long16 |              |

Table 9: SRD01 message

#### 4.5.2 Transmission of Service Data Objects (SDO) of the Safety Parameters

All safety concerning service data objects for device configuration are addressed in expedited Request/Response.

All changes to safety concerning service data objects are monitored via a checksum CRC-16-CCITT and can only be executed in the Pre-Operational NMT state. The polynomial is  $g(x) = x^{16}+x^{12}+x^5+1$ .

Procedure of changing the configuration data in the objects 1301h and 6200h:

- Change values.
- Enter the new valid checksum (sub-index of the relevant object 13FFh or object 61FFh).
- Switch the relevant configuration to valid via object 13FEh or 63FEh.

#### 4.5.3 Procedure for initial commissioning of the SRDO message

The following steps are necessary for the exchange of Safety data via the SRDO message for commissioning:

- Device must be in NMT state "PRE-OPERATIONAL".
- Configuration parameters for SRD01 (see [1301h: SRD01 Communication Parameters](#)) and Safety slope long16 (see [6200h: Safety configuration parameters](#)) must be adapted.
- Calculate checksums (see [13FFh: Safety Configuration Signature \(checksum\)](#) and [63FFh: Safety application configuration signature \(checksum\)](#)).
- Set configurations to valid (see [13FEh: Safety Configuration](#) and [63FEh: Safety application configuration](#)).
- Save configurations as required (see [1010h: Store Parameter](#)).
- Switch to the NMT state "OPERATIONAL" (see [Network management \(NMT\) services](#)).

Then the SRDO message is transmitted according to the configuration parameters.

#### 4.5.4 Example for calculating a checksum

In the following example the checksum CRC-16-CCITT (polynomial 1021h) for SRD01 should be calculated. The checksum is calculated byte by byte and the low byte by the contents of the two objects 1301h and 1381h.

| Object | Sub-index                     | Name  | Extent | Data      |
|--------|-------------------------------|---|--------|-----------|
| 1301h  | SRD01 Communication parameter |   |        |           |
|        | 01h                           | Direction of information                          | 1 byte | 01h       |
|        | 02h                           | Refresh time                                      | 2 byte | 0019h     |
|        | 03h                           | tx: reserved<br>rx: SRVT                          | 1 byte | 14h       |
|        | 04h                           | COB ID 1  | 4 byte | 00000105h |
|        | 05h                           | COB ID 2  | 4 byte | 00000106h |
| 1381h  | SRD01 Mapping parameter       |   |        |           |
|        | 00h                           | Highest sub-index                                 | 1 byte | 04h       |
|        | 01h                           | Sub-index   | 1 byte | 01h       |
|        | 01h                           | Safety Slope long16 1 <sup>st</sup> byte          | 4 byte | 62100108h |
|        | 02h                           | Sub-index   | 1 byte | 02h       |
|        | 02h                           | Inverted Safety Slope long16 1 <sup>st</sup> byte | 4 byte | 62110108h |
|        | 03h                           | Sub-index   | 1 byte | 03h       |
|        | 03h                           | Safety Slope long16 2 <sup>nd</sup> byte          | 4 byte | 62100208h |
|        | 04h                           | Sub-index   | 1 byte | 04h       |
|        | 04h                           | Inverted Safety Slope long16 2 <sup>nd</sup> byte | 4 byte | 62110208h |

The following data bytes are used to calculate the checksum:

0x01 0x19 0x00 0x14 0x05 0x01 0x00 0x00 0x06 0x01 0x00 0x00 0x04 0x01 0x08 0x01 0x10  
0x62 0x02 0x08 0x01 0x11 0x62 0x03 0x08 0x02 0x10 0x62 0x04 0x08 0x02 0x10 0x62

Checksum = 07BFh

#### 4.5.5 Example of change of a configuration

In the following example, the direction of information is to be changed from valid to invalid for SRD01.

Changing the direction of information:

| COB ID         | User data |         |         |           |        |        |        |        |
|----------------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|                | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 600h + Node ID | 2Fh       | 01h     | 13h     | 01h       | 00h    | 00h    | 00h    | 00h    |

For the checksum, the default value 0000h is entered. This means that the checksum must be specified even if the configuration is not changed.

| COB ID         | User data |         |         |           |        |        |        |        |
|----------------|-----------|---------|---------|-----------|--------|--------|--------|--------|
|                | Command   | Index L | Index H | Sub-index | Data 0 | Data 1 | Data 2 | Data 3 |
| 600h + Node ID | 2Bh       | FFh     | 13h     | 01h       | 63h    | 8Ah    | 00h    | 00h    |

Enable the configuration for SRD01. During activation, the configuration is monitored by means of the checksum in object 13FFh sub-indexes 01h. Configurations can only be activated with the correct checksums.

| <b>COB ID</b>  | <b>User data</b> |                |                |                  |               |               |               |               |
|----------------|------------------|----------------|----------------|------------------|---------------|---------------|---------------|---------------|
|                | <b>Command</b>   | <b>Index L</b> | <b>Index H</b> | <b>Sub-index</b> | <b>Data 0</b> | <b>Data 1</b> | <b>Data 2</b> | <b>Data 3</b> |
| 600h + Node ID | 2Fh              | FEh            | 13h            | 00h              | A5h           | 00h           | 00h           | 00h           |

## 4.6 Node monitoring

### 4.6.1 Emergency service (EMCY)

In the case of an error, the status of the bus subscriber is transferred via high-priority emergency messages (emergency telegrams). These messages have a data length of 8 bytes and contain error information.

The emergency message is transferred as soon as a sensor or communication error has occurred or when such errors have been corrected. The cause of the error is deposited in the error buffer (see object [1003h: Pre-defined Error Field](#)). An emergency object is sent only once per error event. Removal of the cause of the error is signaled by sending an emergency message with the error code 0000h (no error). If multiple errors have occurred and one cause of error is removed, the error code 0000h is output as well; the persisting error status is indicated in the error register, however.

| <b>Identifier</b> | <b>Byte 0</b>        | <b>Byte 1</b>                 | <b>Byte 2</b>                     | <b>Byte 3</b> | <b>Byte 4</b> | <b>Byte 5</b> | <b>Byte 6</b> | <b>Byte 7</b> |
|-------------------|----------------------|-------------------------------|-----------------------------------|---------------|---------------|---------------|---------------|---------------|
| 11/ 29 Bit        | Emergency Error Code | Error Register (object 1001h) | Manufacturer-specific error field |               |               |               |               |               |

#### Emergency Error Code:

| <b>Error Description</b>                      | <b>Error Code</b> |
|---|-------------------|
| Cause of the error removed                    | 0000h             |
| Device power supply error Vin                 | 3100h             |
| Internal device power supply error Vcc, Vref  | 3200h             |
| Device temperature error                      | 4200h             |
| Device hardware error                         | 5000h             |
| Device software error                         | 6100h             |
| CAN communication error                       | 8100h             |
| CAN buffer overflow error                     | 8110h             |
| CAN passive error                             | 8120h             |
| Heartbeat or life guarding error              | 8130h             |
| CAN recovered from bus-off error              | 8140h             |
| PDO error not processed due to invalid length | 8210h             |
| PDO length exceeded error                     | 8220h             |

| Error Description             | Error Code |
|-------------------------------|------------|
| Device-specific/sensory error | FF00h      |

*Table 10: Emergency Error Code***Manufacturer-specific error field:**

| Error Description  | Error Code |
|--|------------|
| Lower limit value violation error                                | 0001h      |
| Upper limit value violation error                                | 0002h      |
| Vcc or Vref error  | 0004h      |
| Temperature error  | 0008h      |
| MEMS sensor element error  | 0010h      |
| Controller error   | 0020h      |
| Memory error   | 0040h      |
| Operating mode error   | 0080h      |
| Hardware component error   | 0100h      |
| MEMS saturation measuring range/measuring range exceedance error | 0200h      |
| MEMS self-test error   | 0400h      |
| MEMS communication error   | 0800h      |
| MEMS output rate (sample frequency) error                        | 1000h      |

*Table 11: Manufacturer-specific error field*

The identifier of the emergency object is set to 80h + Node ID by default; however, it can be changed via object 1014h (see [1014h: COB ID Emergency message](#)). Transmission of an emergency message is enabled in the NMT statuses "OPERATIONAL" or "PRE-OPERATIONAL" only. Transmission of the emergency messages can be disabled by setting the COB ID Valid bit to 1.

**4.6.2****Node Guarding**

Node guarding is available for failure monitoring of the CANopen network. During node guarding, the master transmits remote frames (RTR, remote transmit request, message request telegrams) on the guarding identifiers of the nodes to be monitored. The latter respond with the guarding message. This message contains the current NMT status of the node as well as a toggle bit whose value must change after each message. The master assumes that a node error has occurred if status or toggle bits do not correspond with those expected by the master or if there is no response.

Via objects 100Ch (Guard Time) and 100Dh (Life Time Factor) the time interval (Life-Time) is set within which the NMT master expects to receive a response. The time interval "Life Time" is calculated from the cycle time "Guard Time", multiplied with the factor "Life Time Factor". If the NMT master does not receive a response to its RTR frame within the "Life Time", it may react with suitable measures. Upon switching on, node guarding will be enabled by sending the first RTR frame of the master to the slave. Node Guarding is deactivated if the value of either object (100Ch or 100Dh) is set to 0h.

The answer of the node to the RTR frame of the master is formed as follows:

| Identifier     | Byte 0            |                        |
|----------------|-------------------|------------------------|
| 700h + Node ID | Bit 7: Toggle Bit | Bit 6 ... 0: NMT state |

#### **Toggle Bit:**

The toggle bit must alternate between two subsequent responses of the device. After the guarding protocol has been enabled, the toggle bit must have the value 0 with the first response.

#### **NMT state:**

4: STOPPED

5: OPERATIONAL

127: PRE-OPERATIONAL

The identifier of the node guarding protocol is permanently set to 700h + Node ID and cannot be changed. A node guard message can be sent in the NMT statuses "OPERATIONAL", "PRE-OPERATIONAL" or "STOPPED".

#### **Note:**

Literature recommends heartbeat to be used for node monitoring. Only the master can detect missing communication via the node guarding protocol as opposed to the heartbeat that can be received by all subscribers.

### 4.6.3 Heartbeat

The master monitors the state of the slave device via Heartbeat protocol. While doing this, the device sends independently its NMT status cyclically. The IK1R is a heartbeat producer, it does not receive nor process heartbeat protocols itself. The cycle time of the heartbeat message is set via object 1017h. The heartbeat protocol is deactivated if the cycle time is 0h.

The heartbeat message consists of the COB ID and an additional byte. In this byte, the current NMT state is deposited.

| COB ID         | Byte 0    |
|----------------|-----------|
| 700h + Node ID | NMT state |

#### **NMT state:**

4: STOPPED

5: OPERATIONAL

127: PRE-OPERATIONAL

The identifier of the heartbeat protocol is permanently set to 700h + Node ID and cannot be changed. Heartbeat messages are sent in the NMT statuses "OPERATIONAL", "PRE-OPERATIONAL" or "STOPPED".

## 4.7 Layer Setting Service (LSS)

Layer Setting Service (LSS) is a special method described in CiA 305 it serves for retrieving and configuring various parameters (Node ID, baud rate, and Identity Object 1018h).

Every device must have a unique LSS number composed of the entries in Object 1018h.

- Vendor-ID: 0000 0195h
- Product Code: 0201 0002h
- Revision number: FFFF FFFFh
- Serial number: xxxx xxxxh (respective serial number of the inclinometer)

In order to enable the use of full LSS functionality, all devices on the bus must support the LSS method. An LSS master must exist and all nodes must start with the same baud rate. After starting, the device will be in the LSS waiting state. To enable configuration, one or all devices must be switched to the LSS configuration state. If the LSS master expects to receive an answer to its command, only one LSS slave must be switched to the LSS configuration mode.

Two LSS services are available:

- LSS (rx) (LSS Master → Slave): 7E5h
- LSS (tx) (Slave → LSS Master): 7E4h

These LSS identifiers cannot be changed!

A message consists always of 8 bytes. Byte 0 contains the command (Command – Specifier cs), followed by max. 7 data bytes unused data bytes are reserved and must be filled with 00h.

| Service                         | LSS waiting | LSS configuration                          |
|---------------------------------|-------------|--|
| Switch state global             | yes         | yes  |
| Switch state selective          | yes         | no   |
| Activate bit timing parameters  | no          | yes, if all devices on the bus support LSS |
| Configure bit timing parameters | no          | yes  |
| Configure Node ID               | no          | yes  |
| Store configuration             | no          | yes  |
| Request LSS address             | no          | yes  |
| Request Node ID                 | no          | yes  |

Table 12: State behavior of the supported LSS services

### 4.7.1 State change

#### 4.7.1.1 Switch states of all LSS devices (Switch state global)

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 04h               | Mode   | 00h    | 00h    | 00h    | 00h    | 00h    | 00h    |

**Mode:**

00h: Switch to LSS waiting state

01h: Switch to LSS configuration state

**4.7.1.2 Switch states of individual LSS devices (Switch state selective)**

With this command, Individual LSS slave devices can be set to the LSS Configuration state via the unique LSS number.

Master → Slave

| COB ID | User data         |           |        |        |        |        |        |        |
|--------|-------------------|-----------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1    | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 40h               | Vendor ID |        |        | 00h    | 00h    | 00h    |        |

| COB ID | User data         |              |        |        |        |        |        |        |
|--------|-------------------|--------------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1       | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 41h               | Product code |        |        | 00h    | 00h    | 00h    |        |

| COB ID | User data         |                 |        |        |        |        |        |        |
|--------|-------------------|-----------------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1          | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 42h               | Revision number |        |        | 00h    | 00h    | 00h    |        |

| COB ID | User data         |               |        |        |        |        |        |        |
|--------|-------------------|---------------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1        | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 43h               | Serial number |        |        | 00h    | 00h    | 00h    |        |

Slave → Master

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 44h               | 00h    |

## 4.7.2 Configuration

### 4.7.2.1 Setting the Node ID (Configure Node ID)

The LSS master can set the node ID of individual nodes to configuration mode to configure the LSS slave. If the new node ID is intended to still be available after Power off/on, the "Save configuration" command must be output after the change. For immediate activation of the new node ID, the LSS slave must be set to the LSS Waiting mode, followed by an NMT "Reset Communication" 82h. Another possibility would be to execute power off/on after "Save configuration".

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 11h               | NID    | 00h    | 00h    | 00h    | 00h    | 00h    | 00h    |

#### NID:

01h ... 7Fh: Node ID

Slave → Master

| COB ID | User data         |            |            |        |        |        |        |        |
|--------|-------------------|------------|------------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1     | Byte 2     | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 11h               | Error code | Spec error | 00h    | 00h    | 00h    | 00h    | 00h    |

#### Error Code:

00h: Transmission successful

01h: no valid Node ID

FFh: Implementation error see Spec error

#### Spec error:

This byte is nonzero only in case of an implementation error and Error Code FFh.

### 4.7.2.2 Configuration of the baud rate (Configure bit timing parameters)

The baud rate of a single or of multiple LSS slaves can be configured via this command. If the new baud rate is intended to still be available after Power off/on, the "Save configuration" command must be output after the change. To activate the new baud rate the [Activate baud rate \(Activate bit timing parameters\)](#) command must be output and the LSS slave set to the LSS Waiting state. Another possibility of activating the new baud rate would be to execute power off/on after "Save configuration".

Master → Slave

| COB ID | User data         |                |             |        |        |        |        |        |
|--------|-------------------|----------------|-------------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1         | Byte 2      | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 13h               | Table selector | Table index | 00h    | 00h    | 00h    | 00h    | 00h    |

**Table selector:**

00h: CiA 301 bit timing table

80h ... FEh: Manufacturer-specific bit timing table

**Table index:**

| Table index | Baud rate     |
|-------------|---------------|
| 0           | 1000 kbit/s   |
| 1           | 800 kbit/s    |
| 2           | 500 kbit/s    |
| 3           | 250 kbit/s    |
| 4           | 125 kbit/s    |
| 5           | reserved      |
| 6           | 50 kbit/s     |
| 7           | 20 kbit/s     |
| 8           | not supported |
| 9           | not supported |

The device supports only Table selector 00h and Table index 0 until 7.

Slave → Master

| COB ID | User data         |            |            |        |        |        |        |        |
|--------|-------------------|------------|------------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1     | Byte 2     | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 13h               | Error code | Spec error | 00h    | 00h    | 00h    | 00h    | 00h    |

**Error Code:**

00h: Transmission successful

01h: no valid baud rate

FFh: Implementation error see Spec error

**Spec error:**

This byte is nonzero only in case of an implementation error and Error Code FFh.

#### 4.7.2.3 Activate baud rate (Activate bit timing parameters)

This command activates the new baud rate set via [Configuration of the baud rate \(Configure bit timing parameters\)](#) without requiring Power off/on.

Master → Slave

| COB ID | User data         |               |               |        |        |        |        |        |
|--------|-------------------|---------------|---------------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB | Byte 2<br>MSB | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 15h               | Switch delay  |               | 00h    | 00h    | 00h    | 00h    | 00h    |

##### Switch Delay:

The Switch delay parameter defines the length of two delay periods ( $d_1, d_2$ ) of the same length and must correspond with a multiple of 1 ms. After expiry of the individual processing time and delay time  $d_1$ , the new baud rate will be adopted internally. After expiry of the delay time  $d_2$ , the LSS slave will report with the boot up via the newly set baud rate. This procedure prevents the synchronous presence on the bus of devices with different baud rates. The LSS slave cannot send messages during the two delay periods  $d_1$  and  $d_2$ .

#### 4.7.2.4 Store configuration

This command must only be executed if only one LSS slave is in the configuration mode. The current settings will be stored subsequently.

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 17h               | 00h    |

Slave → Master

| COB ID | User data         |               |               |        |        |        |        |        |
|--------|-------------------|---------------|---------------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1        | Byte 2        | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 17h               | Error<br>code | Spec<br>error | 00h    | 00h    | 00h    | 00h    | 00h    |

##### Error Code:

00h: Transmission successful

01h: Store configuration is not supported

02h: Error occurred during storing

FFh: Implementation error see Spec error

##### Spec error:

This byte is nonzero only in case of an implementation error and Error Code FFh.

#### 4.7.3 Requesting parameters

The following requests must only be executed if only one LSS slave is in the configuration mode.

##### 4.7.3.1 Request Vendor ID

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 5Ah               | 00h    |

Slave → Master

| COB ID | User data         |                                |        |        |               |        |        |        |
|--------|-------------------|--------------------------------|--------|--------|---------------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB                  | Byte 2 | Byte 3 | Byte 4<br>MSB | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 5Ah               | Vendor ID (see object 1018.1h) |        |        |               | 00h    | 00h    | 00h    |

##### 4.7.3.2 Request Product Code

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 5Bh               | 00h    |

Slave → Master

| COB ID | User data         |                                   |        |        |               |        |        |        |
|--------|-------------------|-----------------------------------|--------|--------|---------------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB                     | Byte 2 | Byte 3 | Byte 4<br>MSB | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 5Bh               | Product code (see object 1018.2h) |        |        |               | 00h    | 00h    | 00h    |

##### 4.7.3.3 Request revision number

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 5Ch               | 00h    |

Slave → Master

| COB ID | User data         |                                  |        |        |               |        |        |        |
|--------|-------------------|----------------------------------|--------|--------|---------------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB                    | Byte 2 | Byte 3 | Byte 4<br>MSB | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 5Ch               | Revision number (object 1018.3h) |        |        | 00h           | 00h    | 00h    |        |

#### 4.7.3.4 Request serial number

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 5Dh               | 00h    |

Slave → Master

| COB ID | User data         |                                |        |        |               |        |        |        |
|--------|-------------------|--------------------------------|--------|--------|---------------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB                  | Byte 2 | Byte 3 | Byte 4<br>MSB | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 5Dh               | Serial number (object 1018.4h) |        |        | 00h           | 00h    | 00h    |        |

#### 4.7.3.5 Request Node ID

Master → Slave

| COB ID | User data         |        |        |        |        |        |        |        |
|--------|-------------------|--------|--------|--------|--------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 | Byte 6 | Byte 7 |
| 7E5h   | 5Eh               | 00h    |

Slave → Master

| COB ID | User data         |               |        |        |               |        |        |        |
|--------|-------------------|---------------|--------|--------|---------------|--------|--------|--------|
|        | Byte 0<br>Command | Byte 1<br>LSB | Byte 2 | Byte 3 | Byte 4<br>MSB | Byte 5 | Byte 6 | Byte 7 |
| 7E4h   | 5Eh               | Node ID (NID) |        |        | 00h           | 00h    | 00h    |        |

### 4.8 Directory of objects

#### 4.8.1 Overview of objects

The following table offers an overview of the objects of the device.

| Name  | Description   | See page           |
|---|---|--------------------|
| 1000h: Device Type                                    | Device profile and inclinometer type.                                 | <a href="#">31</a> |
| 1001h: Error Register                                 | Current error state of the device.                                    | <a href="#">31</a> |
| 1002h: Manufacturer Status Register                   | Contains the Transmit Error Counter and the Receive Error Counter.    | <a href="#">32</a> |
| 1003h: Pre-defined Error Field                        | The object stores the 8 error states that have occurred last.         | <a href="#">32</a> |
| 1005h: COB ID SYNC message                            | Setting of the COB ID of the SYNC object.                             | <a href="#">33</a> |
| 1008h: Manufacturer Device Name                       | Device name in ASCII notation.  | <a href="#">33</a> |
| 1009h: Manufacturer Hardware Version                  | Indicates the hardware version of the device.                         | <a href="#">34</a> |
| 100Ah: Manufacturer Software Version                  | Indicates the software version of the device.                         | <a href="#">34</a> |
| 100Ch: Guard Time                                     | Parameter for Node Guarding.  | <a href="#">34</a> |
| 100Dh: Life Time Factor                               | Parameter for Node Guarding.  | <a href="#">35</a> |
| 1010h: Store Parameter                                | Object for non-volatile storage of the settings.                      | <a href="#">35</a> |
| 1011h: Restore Parameter                              | Object for restoring the factory settings.                            | <a href="#">37</a> |
| 1014h: COB ID Emergency message                       | COB ID of the Emergency object.                                       | <a href="#">39</a> |
| 1017h: Producer Heartbeat Time                        | Setting of the cycle time of the heartbeat timer.                     | <a href="#">40</a> |
| 1018h: Identity Object                                | Contains the manufacturer number.                                     | <a href="#">40</a> |
| 1200h: Server SDO Parameter                           | SDO Parameter   | <a href="#">41</a> |
| 1301h: SRD01 Communication Parameters                 | SRD01 Communication Parameters.                                       | <a href="#">42</a> |
| 1381h: SRD01 Mapping Parameter                        | SRD01 Transmit Mapping Parameter.                                     | <a href="#">44</a> |
| 13FEh: Safety Configuration                           | Activate Safety configuration for SRD01.                              | <a href="#">45</a> |
| 13FFh: Safety Configuration Signature (checksum)      | Signature (checksum) for SRD01 configuration.                         | <a href="#">45</a> |
| 1800h: 1 <sup>st</sup> Transmit PDO Parameter         | Transmit PDO for asynchronous transfer (timer controlled).            | <a href="#">42</a> |
| 1A00h: 1 <sup>st</sup> Transmit PDO Mapping Parameter | Describes the arrangement of the objects, which are mapped in TPD01.  | <a href="#">48</a> |
| 2000h: Digital filter cut-off frequency               | Defines the set filter time.  | <a href="#">49</a> |
| 5F0Ah: Node ID and baud rate Bus CAN                  | Setting of Node ID and baud rate.                                     | <a href="#">49</a> |
| 6000h: Resolution                                     | Resolution of the Slope long16 value.                                 | <a href="#">50</a> |
| 6010h: Slope long16                                   | Slope long16 value (longitudinal slope).                              | <a href="#">50</a> |
| 6011h: Slope long16 operating parameter               | Operating parameter   | <a href="#">51</a> |
| 6012h: Slope long16 Preset value (calibration value)  | Calibration value for longitudinal slope (Slope long16 preset value). | <a href="#">51</a> |

| Name   | Description  | See page           |
|--|--|--------------------|
| 6013h: Slope long16 Offset   | Application offset of the slope (Slope long16 offset).   | <a href="#">52</a> |
| 6014h: Differential Slope long16 Offset  | Specifies the offset of the Slope long16 value.  | <a href="#">52</a> |
| 6200h: Safety configuration parameters   | Safety calibration value for longitudinal slope (Safety Slope long16 preset value).                  | <a href="#">52</a> |
| 6210h: Safety Slope long16 (Safety longitudinal slope value)                   | Safety Slope long16 (Safety longitudinal slope value).   | <a href="#">53</a> |
| 6211h: Safety inverted Slope long16 (Safety inverted longitudinal slope value) | Safety inverted Slope long16 (Safety inverted longitudinal slope value).                             | <a href="#">54</a> |
| 63FEh: Safety application configuration  | Activate Safety Slope long16 configuration.  | <a href="#">55</a> |
| 63FFh: Safety application configuration signature (checksum)                   | Signature (checksum) via the CANopen Safety parameters of the configuration for Safety Slope long16. | <a href="#">55</a> |
| 6511h: Device temperature  | Indicates the device temperature.  | <a href="#">56</a> |

*Table 13: Overview of objects*

## 4.8.2 Object Description

### 4.8.2.1 1000h: Device Type

Object 1000h indicates the device profile number.

|              |   |        |                        |        |
|--------------|---|--------|------------------------|--------|
| Sub-index    | 00h   |        |                        |        |
| Description  | Information about the device profile and encoder type |        |                        |        |
| Access       | ro  |        |                        |        |
| PDO mapping  | no  |        |                        |        |
| Data type    | UNSIGNED 32   |        |                        |        |
| Default      | 3001019Ah   |        |                        |        |
| EEPROM       | no  |        |                        |        |
| Data content | Device profile -number                                |        | Additional information |        |
|              | Byte 0  | Byte 1 | Byte 2                 | Byte 3 |
|              | 9Ah   | 01h    | 01h                    | 30h    |

019Ah (= 410d): CANopen Device profile for inclinometer

3001h: Class C1, Default PDO mapping, CANopen Safety (Default SRDO mapping)

### 4.8.2.2 1001h: Error Register

Object 1001h indicates the error state of the device.

|              |                      |   |  |
|--------------|----------------------|---|--|
| Sub-index    | 00h                  |   |  |
| Description  | pending error status |   |  |
| Access       | ro                   |   |  |
| PDO mapping  | no                   |   |  |
| Data type    | UNSIGNED 8           |   |  |
| Default      | 0h                   |   |  |
| EEPROM       | no                   |   |  |
| Data content | Bit                  | Meaning   |  |
|              | 0                    | set bit indicates the occurrence of any error condition |  |
|              | 1 ... 6              | not used  |  |

#### 4.8.2.3 1002h: Manufacturer Status Register

Object 1002h outputs the counter readings of the "Receive Error Counter" and "Transmit Error Counter" registers. The contents of these registers provide information on the transmit faults present at the mounting site of the encoder.

|              |  |                        |        |        |
|--------------|--|------------------------|--------|--------|
| Sub-index    | 00h  |                        |        |        |
| Description  | Transmit Error Counter and Receive Error Counter |                        |        |        |
| Access       | ro   |                        |        |        |
| PDO mapping  | no   |                        |        |        |
| Data type    | UNSIGNED 32                                      |                        |        |        |
| Default      | 0h   |                        |        |        |
| EEPROM       | no   |                        |        |        |
| Data content | Byte 0   | Byte 1                 | Byte 2 | Byte 3 |
|              | Receive Error Counter                            | Transmit Error Counter | 01h    | 00h    |

#### 4.8.2.4 1003h: Pre-defined Error Field

In object 1003h, the 8 latest error states are archived.

- The entry under sub-index 0 indicates the number of errors saved.
- The latest error status is always stored in sub-index 01h. Previous error messages "slip onwards" in their position by one sub-index.
- The whole error list is deleted by writing the value 0 in sub-index 00h.
- The entries in the error list have the format described in chapter [4.6.1](#).

|             |                                     |  |  |
|-------------|-------------------------------------|--|--|
| Sub-index   | 00h                                 |  |  |
| Description | number of the error messages stored |  |  |
| Access      | rw                                  |  |  |
| PDO mapping | no                                  |  |  |
| Data type   | UNSIGNED 8                          |  |  |
| Default     | 0h                                  |  |  |
| EEPROM      | yes                                 |  |  |

|             |                              |
|-------------|------------------------------|
| Sub-index   | 01h ... 08h                  |
| Description | error messages that occurred |
| Access      | ro                           |
| PDO mapping | no                           |
| Data type   | UNSIGNED 32                  |
| Default     | 0h                           |
| EEPROM      | yes                          |

#### 4.8.2.5 1005h: COB ID SYNC message

The COB ID of the SYNC object is set via object 1005h.

|              |  |   |
|--------------|--|---|
| Sub-index    | 00h  |   |
| Description  | Defines the COB ID of the synchronization object (SYNC)                              |   |
| Access       | rw (writable in the "Pre-Operational" state only see chapter <a href="#">4.2.1</a> ) |   |
| PDO mapping  | no   |   |
| Data type    | UNSIGNED 32  |   |
| Default      | 80h  |   |
| EEPROM       | yes  |   |
| Data content | Bit 31   | not defined   |
|              | Bit 30   | 0: The device generates no SYNC message                                 |
|              | Bit 29   | 0: 11bits identifier (CAN 2.0A)<br>1: 29bits identifier (CAN 2.0B)      |
|              | Bit 28 ... 11  | 0: if bit 29 = 0<br>X: Bits 28 ... 11 of the SYNC-COB ID, if Bit 29 = 1 |
|              | Bit 10 ... 0   | X: Bits 10 ... 0 of the SYNC-COB ID                                     |

#### 4.8.2.6 1008h: Manufacturer Device Name

Object 1008h indicates the device name.

|              |                               |              |              |              |          |          |          |          |
|--------------|-------------------------------|--------------|--------------|--------------|----------|----------|----------|----------|
| Sub-index    | 00h                           |              |              |              |          |          |          |          |
| Description  | Device name in ASCII notation |              |              |              |          |          |          |          |
| Access       | const                         |              |              |              |          |          |          |          |
| PDO mapping  | no                            |              |              |              |          |          |          |          |
| Data type    | Visible_String                |              |              |              |          |          |          |          |
| EEPROM       | no                            |              |              |              |          |          |          |          |
| Data content | Byte 0                        | Byte 1       | Byte 2       | Byte 3       | Byte 4   | Byte 5   | Byte 6   | Byte 7   |
|              | 49h<br>("I")                  | 4Bh<br>("K") | 31h<br>("1") | 52h<br>("R") | 00h<br>- | 00h<br>- | 00h<br>- | 00h<br>- |

#### 4.8.2.7 1009h: Manufacturer Hardware Version

Object 1009h indicates the hardware version.

|              |                                    |          |          |          |          |          |          |          |
|--------------|------------------------------------|----------|----------|----------|----------|----------|----------|----------|
| Sub-index    | 00h                                |          |          |          |          |          |          |          |
| Description  | Hardware version in ASCII notation |          |          |          |          |          |          |          |
| Access       | const                              |          |          |          |          |          |          |          |
| PDO mapping  | no                                 |          |          |          |          |          |          |          |
| Data type    | Visible_String                     |          |          |          |          |          |          |          |
| Default      | 0h                                 |          |          |          |          |          |          |          |
| EEPROM       | no                                 |          |          |          |          |          |          |          |
| Data content | Byte 0                             | Byte 1   | Byte 2   | Byte 3   | Byte 4   | Byte 5   | Byte 6   | Byte 7   |
|              | 30h<br>("0")                       | 00h<br>- |

#### 4.8.2.8 100Ah: Manufacturer Software Version

Object 100Ah indicates the software version of the device. Because this contains 7 data bytes, the SDO Normal Transfer is required for reading.

|              |                                    |              |               |              |               |              |              |              |
|--------------|------------------------------------|--------------|---------------|--------------|---------------|--------------|--------------|--------------|
| Sub-index    | 00h                                |              |               |              |               |              |              |              |
| Description  | Software version in ASCII notation |              |               |              |               |              |              |              |
| Access       | const                              |              |               |              |               |              |              |              |
| PDO mapping  | no                                 |              |               |              |               |              |              |              |
| Data type    | Visible_String                     |              |               |              |               |              |              |              |
| Default      | 0h                                 |              |               |              |               |              |              |              |
| EEPROM       | no                                 |              |               |              |               |              |              |              |
| Data content | Byte 0                             | Byte 1       | Byte 2        | Byte 3       | Byte 4        | Byte 5       | Byte 6       | Byte 7       |
|              | -                                  | 31h<br>("1") | 2Eh<br>(".".) | 30h<br>("0") | 2Eh<br>(".".) | 30h<br>("0") | 37h<br>("7") | 32h<br>("2") |

#### 4.8.2.9 100Ch: Guard Time

Object 100Ch indicates the cycle time set in the master for node guarding (see chapter 4.6.2). The cycle time is indicated in milliseconds Value "0h" means that Node Guarding is deactivated.

|             |             |  |  |  |  |  |  |  |
|-------------|-------------|--|--|--|--|--|--|--|
| Sub-index   | 00h         |  |  |  |  |  |  |  |
| Description | Guard Time  |  |  |  |  |  |  |  |
| Access      | rw          |  |  |  |  |  |  |  |
| PDO mapping | no          |  |  |  |  |  |  |  |
| Data type   | UNSIGNED 16 |  |  |  |  |  |  |  |
| Default     | 0h          |  |  |  |  |  |  |  |
| EEPROM      | yes         |  |  |  |  |  |  |  |

#### 4.8.2.10 100Dh: Life Time Factor

Object 100Dh indicates the life time factor set in the master for node guarding (see chapter 4.6.2). Value "0h" means that Node Guarding is deactivated.

|             |                  |
|-------------|------------------|
| Sub-index   | 00h              |
| Description | Life Time Factor |
| Access      | rw               |
| PDO mapping | no               |
| Data type   | UNSIGNED 8       |
| Default     | 0h               |
| EEPROM      | yes              |

#### 4.8.2.11 1010h: Store Parameter

Parameters are transferred into the EEPROM with this object in order to ensure that they are protected from loss of voltage. Different parameter groups are stored depending on the selection of the sub-index to be accessed. The string "Save" must be sent as data content.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 4h  |
| EEPROM      | no  |

|              |  |
|--------------|--|
| Sub-index    | 01h  |
| Description  | save all parameters  |
| Access       | rw   |
| PDO mapping  | no   |
| Data type    | UNSIGNED 32  |
| Default      | 1h   |
| EEPROM       | no   |
| Data content | Write:   |
|              | Byte 0      Byte 1      Byte 2      Byte 3                   |
|              | 73h ("s")      61h ("a")      76h ("v")      65h ("e")       |
|              | Read:  |
|              | Bit 31 ... 2      0: reserved                                |
|              | Bit 1      0: Device does not independently store parameters |
|              | Bit 0      1: Device stores parameters after command         |

|              |   |   |           |           |
|--------------|---|---|-----------|-----------|
| Sub-index    | 02h   |   |           |           |
| Description  | save only communication parameters (1000h ... 1FFFh, CiA 301) |   |           |           |
| Access       | rw  |   |           |           |
| PDO mapping  | no  |   |           |           |
| Data type    | UNSIGNED 32   |   |           |           |
| Default      | 1h  |   |           |           |
| EEPROM       | no  |   |           |           |
| Data content | Write:  |   |           |           |
|              | Byte 0  | Byte 1  | Byte 2    | Byte 3    |
|              | 73h ("s")   | 61h ("a")   | 76h ("v") | 65h ("e") |
|              | Read:   |   |           |           |
|              | Bit 31 ... 2  | 0: reserved                                       |           |           |
|              | Bit 1   | 0: Device does not independently store parameters |           |           |
|              | Bit 0   | 1: Device stores parameters after command         |           |           |

|              |   |   |           |           |
|--------------|---|---|-----------|-----------|
| Sub-index    | 03h   |   |           |           |
| Description  | save only application parameters (6000h ... 9FFFh, CiA 410) |   |           |           |
| Access       | rw  |   |           |           |

|              | Bit 31 ... 2   | 0: reserved                                       |           |           |
|              | Bit 1  | 0: Device does not independently store parameters |           |           |
|              | Bit 0  | 1: Device stores parameters after command         |           |           |

#### 4.8.2.12 1011h: Restore Parameter

Object 1011h restores the factory settings of the device depending on the selection. The string "Load" must be sent as data content and the device reset thereafter. If the restored parameters are intended to be permanently available, they must be stored via object [1010h: Store Parameter](#).

|              | Bit 31 ... 1  | 0: reserved                                      |           |           |
|              | Bit 0   | 1: Device permits loading of default parameters. |           |           |

#### 4.8.2.13 1014h: COB ID Emergency message

The COB ID of the Emergency object is set via object 1014h (see chapter [4.6.1](#))

|              |  |   |
|--------------|--|---|
| Sub-index    | 00h  |   |
| Description  | Defines the COB ID of the Emergency object (EMCY)                                    |   |
| Access       | rw (writable in the "Pre-Operational" state only see chapter <a href="#">4.2.1</a> ) |   |
| PDO mapping  | no   |   |
| Data type    | UNSIGNED 32  |   |
| Default      | 80h + Node ID  |   |
| EEPROM       | yes  |   |
| Data content | Bit 31   | 0: EMCY object exists / is valid<br>1: EMCY object does not exists / is invalid |
|              | Bit 30   | always 0b   |
|              | Bit 29   | 0: 11bits identifier (CAN 2.0A)<br>1: 29bits identifier (CAN 2.0B)              |
|              | Bit 28 ... 11  | 0: if bit 29 = 0b<br>X: Bits 28 ... 11 of the EMCY-COB ID, if Bit 29 = 1b       |
|              | Bit 10 ... 0   | X: Bits 10 ... 0 of the EMCY-COB ID   |

#### 4.8.2.14 1017h: Producer Heartbeat Time

The cycle time "Heartbeat Time" for the heartbeat protocol is set via object 1017h. The cycle time is indicated in milliseconds.

|              |  |
|--------------|--|
| Sub-index    | 00h  |
| Description  | defines the cycle time of the heartbeat monitoring service   |
| Access       | rw   |
| PDO mapping  | no   |
| Data type    | UNSIGNED 16  |
| Default      | 0h   |
| EEPROM       | yes  |
| Data content | 0d, 10d ... 65535d (0h, Ah ... FFFFh); the numerical value corresponds to a multiple of 1 ms. Value 0h disables the service. |

#### 4.8.2.15 1018h: Identity Object

The manufacturer identification number (Vendor ID) is indicated by object 1018h.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 4h  |
| EEPROM      | no  |

|             |   |
|-------------|---|
| Sub-index   | 01h   |
| Description | the manufacturer identification number (vendor ID) for the company SIKO GmbH allocated by the CiA |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | UNSIGNED 32   |
| Default     | 00000195h   |
| EEPROM      | no  |

|             |              |
|-------------|--------------|
| Sub-index   | 02h          |
| Description | Product Code |
| Access      | ro           |
| PDO mapping | no           |
| Data type   | UNSIGNED 32  |
| Default     | 02010002h    |
| EEPROM      | no           |

|             |   |
|-------------|---|
| Sub-index   | 03h   |
| Description | Revision number (function is not supported, only compatibility entry for various configurators) |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | UNSIGNED 32   |
| Default     | FFFFFFFFh   |
| EEPROM      | no  |

|             |               |
|-------------|---------------|
| Sub-index   | 04h           |
| Description | Serial number |
| Access      | ro            |
| PDO mapping | no            |
| Data type   | UNSIGNED 32   |
| Default     | 1h            |
| EEPROM      | yes           |

#### 4.8.2.16 1200h: Server SDO Parameter

The COB IDs for the server SDOs are indicated via object 1200h. The COB IDs cannot be changed.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 2h  |
| EEPROM      | no  |

|             |                              |
|-------------|------------------------------|
| Sub-index   | 01h                          |
| Description | COB ID Client -> Server (rx) |
| Access      | ro                           |
| PDO mapping | no                           |
| Data type   | UNSIGNED 32                  |
| Default     | 00000600h + Node ID          |
| EEPROM      | no                           |

|             |                              |
|-------------|------------------------------|
| Sub-index   | 02h                          |
| Description | COB ID Server -> Client (tx) |
| Access      | ro                           |
| PDO mapping | no                           |
| Data type   | UNSIGNED 32                  |
| Default     | 00000580h + Node ID          |
| EEPROM      | no                           |

#### 4.8.2.17 1301h: SRD01 Communication Parameters

The communication behavior of SRD01 can be determined via object 1301h.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 6h  |
| EEPROM      | no  |

|              |  |
|--------------|--|
| Sub-index    | 01h  |
| Description  | Direction of information   |
| Access       | ro, if NMT state is operational<br>rw, if NMT state is pre-operational |
| PDO mapping  | no   |
| Data type    | UNSIGNED 8   |
| Default      | 1h   |
| EEPROM       | yes  |
| Data content | 0: SRD01 is not valid<br>1: SRD01 is TX and valid                      |

|              |  |
|--------------|--|
| Sub-index    | 02h  |
| Description  | refresh time   |
| Access       | ro, if NMT state is operational<br>rw, if NMT state is pre-operational |
| PDO mapping  | no   |
| Data type    | UNSIGNED 16  |
| Default      | 25d (0019h)  |
| EEPROM       | yes  |
| Data content | 10d ... 65535d (000Ah ... FFFFh)                                       |

|              |  |
|--------------|--|
| Sub-index    | 03h  |
| Description  | tx: reserved<br>rx: SRVT   |
| Access       | ro, if NMT state is operational<br>rw, if NMT state is pre-operational |
| PDO mapping  | no   |
| Data type    | UNSIGNED 8   |
| Default      | 20d (14h)  |
| EEPROM       | yes  |
| Data content | 0d ... 65535d (0000h ... FFFFh)  |

|             |                   |
|-------------|-------------------|
| Sub-index   | 04h               |
| Description | transmission type |
| Access      | ro                |
| PDO mapping | no                |
| Data type   | UNSIGNED 8        |
| Default     | 254d (FEh)        |
| EEPROM      | no                |

|              |  |
|--------------|--|
| Sub-index    | 05h  |
| Description  | COB ID1  |
| Access       | ro, if NMT state is operational<br>rw, if NMT state is pre-operational |
| PDO mapping  | no   |
| Data type    | UNSIGNED 32  |
| Default      | 000000FFh + 2*Node ID  |
| EEPROM       | yes  |
| Data content | 257d (101h) ... 383d (17Fh) (odd numerical values only)                |

|              |  |
|--------------|--|
| Sub-index    | 06h  |
| Description  | COB ID2  |
| Access       | ro, if NMT state is operational<br>rw, if NMT state is pre-operational |
| PDO mapping  | no   |
| Data type    | UNSIGNED 32  |
| Default      | 00000100h + 2*Node ID  |
| EEPROM       | yes  |
| Data content | 258d (102h) ... 384d (180h) (even numerical values only)               |

#### 4.8.2.18 1381h: SRD01 Mapping Parameter

Object 1381h determines the objects that are mapped in the first Transmit SRDO (SRD01).

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 4h  |
| EEPROM      | no  |

|             |  |
|-------------|--|
| Sub-index   | 01h  |
| Description | 1 <sup>st</sup> object of the SRD01 message with the COB ID1 (data byte 0) |
| Access      | ro   |
| PDO mapping | no   |
| Data type   | UNSIGNED 32  |
| Default     | 62100108h (Safety Slope long16 object 6210h, sub-index 01h, 8bit)          |
| EEPROM      | no   |

|             |  |
|-------------|--|
| Sub-index   | 02h  |
| Description | 1 <sup>st</sup> object of the SRD01 message with the COB ID2 (data byte 0) |
| Access      | ro   |
| PDO mapping | no   |
| Data type   | UNSIGNED 32  |
| Default     | 62110108h (inverted Safety Slope long16 object 6211h, sub-index 01h, 8bit) |
| EEPROM      | no   |

|             |  |
|-------------|--|
| Sub-index   | 03h  |
| Description | 2 <sup>nd</sup> object of the SRD01 message with the COB ID1 (data byte 1) |
| Access      | ro   |
| PDO mapping | no   |
| Data type   | UNSIGNED 32  |
| Default     | 62100208h (Safety Slope long16 object 6210h, sub-index 02h, 8bit)          |
| EEPROM      | no   |

|             |  |
|-------------|--|
| Sub-index   | 04h  |
| Description | 2 <sup>nd</sup> object of the SRD01 message with the COB ID2 (data byte 1) |
| Access      | ro   |
| PDO mapping | no   |
| Data type   | UNSIGNED 32  |
| Default     | 62110208h (inverted Safety Slope long16 object 6211h, sub-index 02h, 8bit) |
| EEPROM      | no   |

#### 4.8.2.19 13FEh: Safety Configuration

The SRD0 configuration can be switched to valid by means of object 13FEh.

|              |   |
|--------------|---|
| Sub-index    | 00h   |
| Description  | This parameter will be switched to invalid automatically after changing a parameter in object 1301h and must be switched valid again via this object. Switching to valid is only enabled if the correct signatures are entered in object 13FFh. |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | UNSIGNED 8  |
| Default      | 0h  |
| EEPROM       | yes   |
| Data content | A5h: SRD01 configuration valid<br>00h ... A4h and A6h ... FFh: SRD01 configuration invalid  |

#### 4.8.2.20 13FFh: Safety Configuration Signature (checksum)

This object 13FFh contains the signatures (checksums) via the CANopen Safety parameters of the SRD01 configuration. Only a checksum which is valid at that time can be transmitted. The checksum is checked anew before switching the configuration to valid. Any change to the configuration will be valid only after passing.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | ro  |

|--------------|---|
| Sub-index    | 05h   |
| Description  | Event timer for TPD01   |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | UNSIGNED 16   |
| Default      | 0h  |
| EEPROM       | yes   |
| Data content | The service is disabled by writing the value 0h. If the value is changed with the timer running, the change will be applied only with the next timer operation. |

#### 4.8.2.22 1A00h: 1<sup>st</sup> Transmit PDO Mapping Parameter

Object 1A00h determines the objects that are mapped on the first Transmit PDO (TPD01).

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 1h  |
| EEPROM      | no  |

|             |  |
|-------------|--|
| Sub-index   | 01h  |
| Description | 1 <sup>st</sup> Object of the PD01 message (Data byte 0 and 1) |
| Access      | ro   |
| PDO mapping | no   |
| Data type   | UNSIGNED 32  |
| Default     | 60100010h (Slope long16 object 6010h, sub-index 00h, 16bit)    |
| EEPROM      | yes  |

#### 4.8.2.23 2000h: Digital filter cut-off frequency

The filter time can be set in object 2000h.

|              |   |
|--------------|---|
| Sub-index    | 00h   |
| Description  | Defines the set filter time.  |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | UNSIGNED 16   |
| Default      | 14h (20d)   |
| EEPROM       | yes   |
| Data content | 1d = 0.1 Hz. Default value: 20 Hz.<br>Possible values:<br>1d ... 20d (1d ... 14h) in steps of one (= 0.1 ... 1.0 Hz in 0.1 Hz steps);<br>10d ... 200d (14h ... C8h) in steps of ten (= 1.0 ... 20.0 Hz in 1 Hz steps) |

#### 4.8.2.24 5F0Ah: Node ID and baud rate Bus CAN

Node ID and baud rate of the bus can be set via Object 5F0Ah.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 2h  |
| EEPROM      | no  |

|              |                                |
|--------------|--------------------------------|
| Sub-index    | 01h                            |
| Description  | Node ID                        |
| Access       | rw                             |
| PDO mapping  | no                             |
| Data type    | UNSIGNED 8                     |
| Default      | 3h (redundant inclinometer 4h) |
| EEPROM       | yes                            |
| Data content | 01h ... 7Fh                    |

|              |   |
|--------------|---|
| Sub-index    | 02h   |
| Description  | Baud rate of the CAN bus  |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | UNSIGNED 8  |
| Default      | 5h (500 kbit/s)   |
| EEPROM       | yes   |
| Data content | 1h: 20 kbit/s<br>2h: 50 kbit/s<br>3h: 125 kbit/s<br>4h: 250 kbit/s<br>5h: 500 kbit/s (Default)<br>6h: 800 kbit/s<br>7h: 1000 kbit/s |

#### 4.8.2.25 6000h: Resolution

The resolution of the Slope long16 value can be set in object 6000h.

|              |  |         |                   |          |  |            |  |              |                 |
|--------------|--|---------|-------------------|----------|--|------------|--|--------------|-----------------|
| Sub-index    | 00h  |         |                   |          |  |            |  |              |                 |
| Description  | Resolution   |         |                   |          |  |            |  |              |                 |
| Access       | rw   |         |                   |          |  |            |  |              |                 |
| PDO mapping  | no   |         |                   |          |  |            |  |              |                 |
| Data type    | UNSIGNED 16  |         |                   |          |  |            |  |              |                 |
| Default      | 64h  |         |                   |          |  |            |  |              |                 |
| EEPROM       | yes  |         |                   |          |  |            |  |              |                 |
| Data content | <table border="1"> <tr> <td>1d (1h)</td> <td>Resolution 0.001°</td> </tr> <tr> <td>10d (Ah)</td> <td>Resolution 0.01° (Default for measuring range ±180°)</td> </tr> <tr> <td>100d (64h)</td> <td>Resolution 0.1° (Default for measuring range 360°)</td> </tr> <tr> <td>1000d (3E8h)</td> <td>Resolution 1.0°</td> </tr> </table> | 1d (1h) | Resolution 0.001° | 10d (Ah) | Resolution 0.01° (Default for measuring range ±180°) | 100d (64h) | Resolution 0.1° (Default for measuring range 360°) | 1000d (3E8h) | Resolution 1.0° |
| 1d (1h)      | Resolution 0.001°  |         |                   |          |  |            |  |              |                 |
| 10d (Ah)     | Resolution 0.01° (Default for measuring range ±180°)   |         |                   |          |  |            |  |              |                 |
| 100d (64h)   | Resolution 0.1° (Default for measuring range 360°)   |         |                   |          |  |            |  |              |                 |
| 1000d (3E8h) | Resolution 1.0°  |         |                   |          |  |            |  |              |                 |

Scaling of dependent objects with the formula Object \* [Object 6000h] / 1000.

#### 4.8.2.26 6010h: Slope long16

Object 6010h indicates the current Slope long16 value (longitudinal slope).

|             |  |
|-------------|--|
| Sub-index   | 00h                                      |
| Description | Slope long16 value (longitudinal slope). |
| Access      | ro                                       |
| PDO mapping | no                                       |
| Data type   | INTEGER 16                               |
| Default     | 0h                                       |
| EEPROM      | yes                                      |

#### 4.8.2.27 6011h: Slope long16 operating parameter

Operating parameters can be set via object 6011h. If scaling of object 6010h is active, the following formula applies:

Slope long16 = slope physical measured + differential slope long16 preset + slope long16 offset

If scaling is not active, the Slope long16 value corresponds to the physically measured slope.

|              |                     |   |
|--------------|---------------------|---|
| Sub-index    | 00h                 |   |
| Description  | Operating parameter |   |
| Access       | rw                  |   |
| PDO mapping  | no                  |   |
| Data type    | UNSIGNED 8          |   |
| Default      | 0h                  |   |
| EEPROM       | yes                 |   |
| Data content | Bit 6 ... 7         | not used  |
|              | Bit 5               | 0 = Measuring range 0 ... 360° (Resolution 0.1°)<br>1 = Measuring range ±180° (Resolution 0.1°)<br>If the measuring range is changed, the new resolution is set provided that the default value was not changed beforehand. |
|              | Bit 2 ... 4         | not used  |
|              | Bit 1               | 0 = Scaling of object 6010h inactive<br>1 = Scaling of object 6010h active  |
|              | Bit 0               | 0 = Inverting of object 6010h inactive<br>1 = Inverting of object 6010h active  |

#### 4.8.2.28 6012h: Slope long16 Preset value (calibration value)

The preset value for the longitudinal slope (Slope long16 preset value) can be set by object 6012h. The Slope long16 value is immediately set to the transferred value. The slope long16 preset value must be specified in ° with the preset resolution of object 6000h. The calculated application offset of the longitudinal slope value (Slope long16 offset) is specified in object 6013h and is dependent on object 6014h.

|              |   |  |
|--------------|---|--|
| Sub-index    | 00h                                       |  |
| Description  | Calibration value for longitudinal slope. |  |
| Access       | rw  |  |
| PDO mapping  | no  |  |
| Data type    | INTEGER 16                                |  |
| Default      | 0h  |  |
| EEPROM       | yes                                       |  |
| Data content | 0h ... FFFFh                              |  |

#### 4.8.2.29 6013h: Slope long16 Offset

The application offset of the longitudinal axis is specified in object 6013h. The value must be specified in ° with the resolution set for object 6000h.

Slope long16 offset = slope long16 –slope physical measured – differential slope long16 preset

|              |  |
|--------------|--|
| Sub-index    | 00h  |
| Description  | Application offset of the slope (Slope long16 offset). |
| Access       | rw   |
| PDO mapping  | no   |
| Data type    | INTEGER 16   |
| Default      | 0h   |
| EEPROM       | yes  |
| Data content | 0h ... FFFFh   |

#### 4.8.2.30 6014h: Differential Slope long16 Offset

Object 6014h indicates the offset of the Slope long16 value (object 6010h) as a function of the Slope long16 preset value (object 6012h) and the Slope long16 offset (object 6013h). The value must be specified in ° with the resolution set for object 6000h.

|              |   |
|--------------|---|
| Sub-index    | 00h   |
| Description  | Specifies the offset of the Slope long16 value. |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | INTEGER 16                                      |
| Default      | 0h  |
| EEPROM       | yes   |
| Data content | 0h ... FFFFh                                    |

#### 4.8.2.31 6200h: Safety configuration parameters

The Safety preset value for the Safety longitudinal slope (Safety Slope long16 preset value) can be set in object 6012h. The Safety Slope long16 preset value must be specified in ° with the preset resolution of object 6000h.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 1h  |
| EEPROM      | no  |

|              |   |
|--------------|---|
| Sub-index    | 01h   |
| Description  | Safety calibration value for longitudinal slope (Safety Slope long16 preset value). |
| Access       | ro when NMT state is operational<br>rw when NMT state is pre-operational            |
| PDO mapping  | no  |
| Data type    | INTEGER 16  |
| Default      | 0h  |
| EEPROM       | yes   |
| Data content | 0h ... FFFFh  |

#### 4.8.2.32 6210h: Safety Slope long16 (Safety longitudinal slope value)

The Safety Slope long16 (Safety longitudinal slope value) can be read byte by byte via object 6210h.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 2h  |
| EEPROM      | no  |

|             |  |
|-------------|--|
| Sub-index   | 01h                                      |
| Description | Safety slope long16 1 <sup>st</sup> byte |
| Access      | ro                                       |
| PDO mapping | no                                       |
| Data type   | INTEGER 8                                |
| Default     | 0h                                       |
| EEPROM      | no                                       |

|             |  |
|-------------|--|
| Sub-index   | 02h                                      |
| Description | Safety slope long16 2 <sup>nd</sup> byte |
| Access      | ro                                       |
| PDO mapping | no                                       |
| Data type   | INTEGER 8                                |
| Default     | 0h                                       |
| EEPROM      | no                                       |

#### 4.8.2.33 6211h: Safety inverted Slope long16 (Safety inverted longitudinal slope value)

The Safety inverted Slope long16 (Safety inverted longitudinal slope value) can be read byte by byte via object 6211h.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | const                                     |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 2h  |
| EEPROM      | no  |

|             |   |
|-------------|---|
| Sub-index   | 01h   |
| Description | Safety inverted slope long16 1 <sup>st</sup> Byte |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | INTEGER 8   |
| Default     | 0h  |
| EEPROM      | no  |

|             |   |
|-------------|---|
| Sub-index   | 02h   |
| Description | Safety inverted slope long16 2 <sup>nd</sup> Byte |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | INTEGER 8   |
| Default     | 0h  |
| EEPROM      | no  |

#### 4.8.2.34 63FEh: Safety application configuration

The Safety Slope long16 can be switched to valid via object 61FEh.

|              |   |
|--------------|---|
| Sub-index    | 00h   |
| Description  | This parameter is automatically invalidated after a parameter in object 6200h has been changed and must be set to valid again via this object. Switching to valid is only possible if the correct signatures are entered in object 13FFh. |
| Access       | rw  |
| PDO mapping  | no  |
| Data type    | UNSIGNED 8  |
| Default      | 0h  |
| EEPROM       | yes   |
| Data content | A5h: Configuration for Safety Slope long16 valid<br>00h ... A4h and A6h ... FFh: Configuration for Safety Slope long16 not valid  |

#### 4.8.2.35 63FFh: Safety application configuration signature (checksum)

This object 63FFh contains the signatures (checksums) via the CANopen Safety parameters of the configuration for Safety Slope long16. Only a checksum valid at the time can be transferred. Before the configuration is set to valid, the checksum is checked again. Only then does a change in the configuration become valid.

|             |   |
|-------------|---|
| Sub-index   | 00h                                       |
| Description | indicates the largest supported sub-index |
| Access      | ro  |
| PDO mapping | no  |
| Data type   | UNSIGNED 8                                |
| Default     | 1h  |
| EEPROM      | no  |

|              |  |           |  |        |                               |
|--------------|--|-----------|--|--------|-------------------------------|
| Sub-index    | 01h  |           |  |        |                               |
| Description  | Signature safety slope long16 (checksum)                                 |           |  |        |                               |
| Access       | rw   |           |  |        |                               |
| PDO mapping  | no   |           |  |        |                               |
| Data type    | UNSIGNED 16  |           |  |        |                               |
| Default      | 0000h  |           |  |        |                               |
| EEPROM       | yes  |           |  |        |                               |
| Data content | The checksum CRC-16-CCITT is calculated via the content of object 6200h. |           |  |        |                               |
|              | Object   | Sub-index | Name   | Extent | Value                         |
|              | 6200h  | 00h       | Highest sub-index  | 1 byte | 01h                           |
|              |  | 01h       | Sub-index  | 1 byte | 01h                           |
|              |  | 01h       | Safety Slope long16<br>Preset value (Safety calibration value) | 2 byte | Object 6200h<br>sub-index 01h |

#### 4.8.2.36 6511h: Device temperature

The current device temperature can be read in object 6511h.

|             |                                      |  |  |  |  |
|-------------|--------------------------------------|--|--|--|--|
| Sub-index   | 00h                                  |  |  |  |  |
| Description | Device temperature in 1° increments. |  |  |  |  |
| Access      | ro                                   |  |  |  |  |
| PDO mapping | no                                   |  |  |  |  |
| Data type   | INTEGER 16                           |  |  |  |  |
| Default     | 0h                                   |  |  |  |  |
| EEPROM      | no                                   |  |  |  |  |
